

ABSTRACT OF THE DISCLOSURE

A stringed instrument case comprises a case body and a cover, wherein an internal member made of a foam resin is arranged inside of the case body to form a storage hollow allowing a stringed instrument to be stored therein. A body fixing member for fixing a body of the stringed instrument at a prescribed position is arranged and adequately positioned in the storage hollow in response to the size of the body, and a neck fixing member having a plurality of neck reception portions each capable of receiving a tip end portion of a neck of the stringed instrument is arranged in the storage hollow with a prescribed distance apart from the body fixing member, wherein the neck fixing member can be adjusted in position in the longitudinal direction of the case body.
